

ABSTRACT

A media player controller is disclosed that monitors user activity and automatically activates a media player in response to predefined events. The disclosed media player controller includes one or more audio/visual image capture devices focused on one or more users. The captured audio and video information is processed by the media player controller to identify one or more predefined events. A number of rules can be utilized to define various user events suggesting that the media player should be activated, such as when the user enters the room and demonstrates certain behavior. Each rule contains one or more conditions, and, optionally, a corresponding action-item that should be performed when the rule is satisfied. Upon detection of a predefined event, the corresponding action, if any, is performed by the media player controller.
